Human-centered Generative AI for Advancing Sense of Place

Speaker: Yuhao Kang

GISense Lab, Department of Geography & the Environment

The University of Texas at Austin

Human-centered Geospatial Data Science

1

Understand human experience

- Human perceptions of place
- Human emotions at place
- Human cognition of place
- Human creativity
- ...

2

Develop *trustworthy* and *ethical* GIScience technology

- Mitigate bias
- Protect human geoprivacy
- Enhance explainability of GeoAI
- Build inclusive GeoAI
- ...

Large Language Models

Communicate with people

KK

What is cartography?

Cartography is the science and art of making maps. It involves the representation of spatial data in a way that communicates information effectively to users. A cartographer is someone who practices cartography and designs or produces maps.

The process of map-making has evolved significantly over time, from ancient hand-drawn maps to the sophisticated digital maps of today. Cartographers today utilize a variety of tools, including Geographic Information Systems (GIS), to create detailed and accurate maps.

Diffusion Models

Create graphics

Place = Space + Human Meaning (Tuan, 1979)

Sense of place denotes those nebulous human meanings such as **subjective feelings** and **perceptions** that evoke different **emotions, experiences, and identities** attached to the place (Kang, 2021)

Can we enrich our understanding of human sense of place using generative artificial intelligence (GenAI)?

Traditional Methods

- Self-reports
- Surveys
- Mental maps

Sense of Place

- Lively
- Safe
- Beautiful
- ...

- Small scales
- Labor-intensive
- Time-consuming

Are there better ways to measure and understand human sense of place?

Audio 1

Audio 2

Challenge

Lack of **intuitive** ways to **effectively** and **vividly** characterize the acoustic environment, especially when compared with those methods for visual perceptions

Auditory Perceptions

Spectrograms

Acoustic Signal Attributes

Visual Perceptions

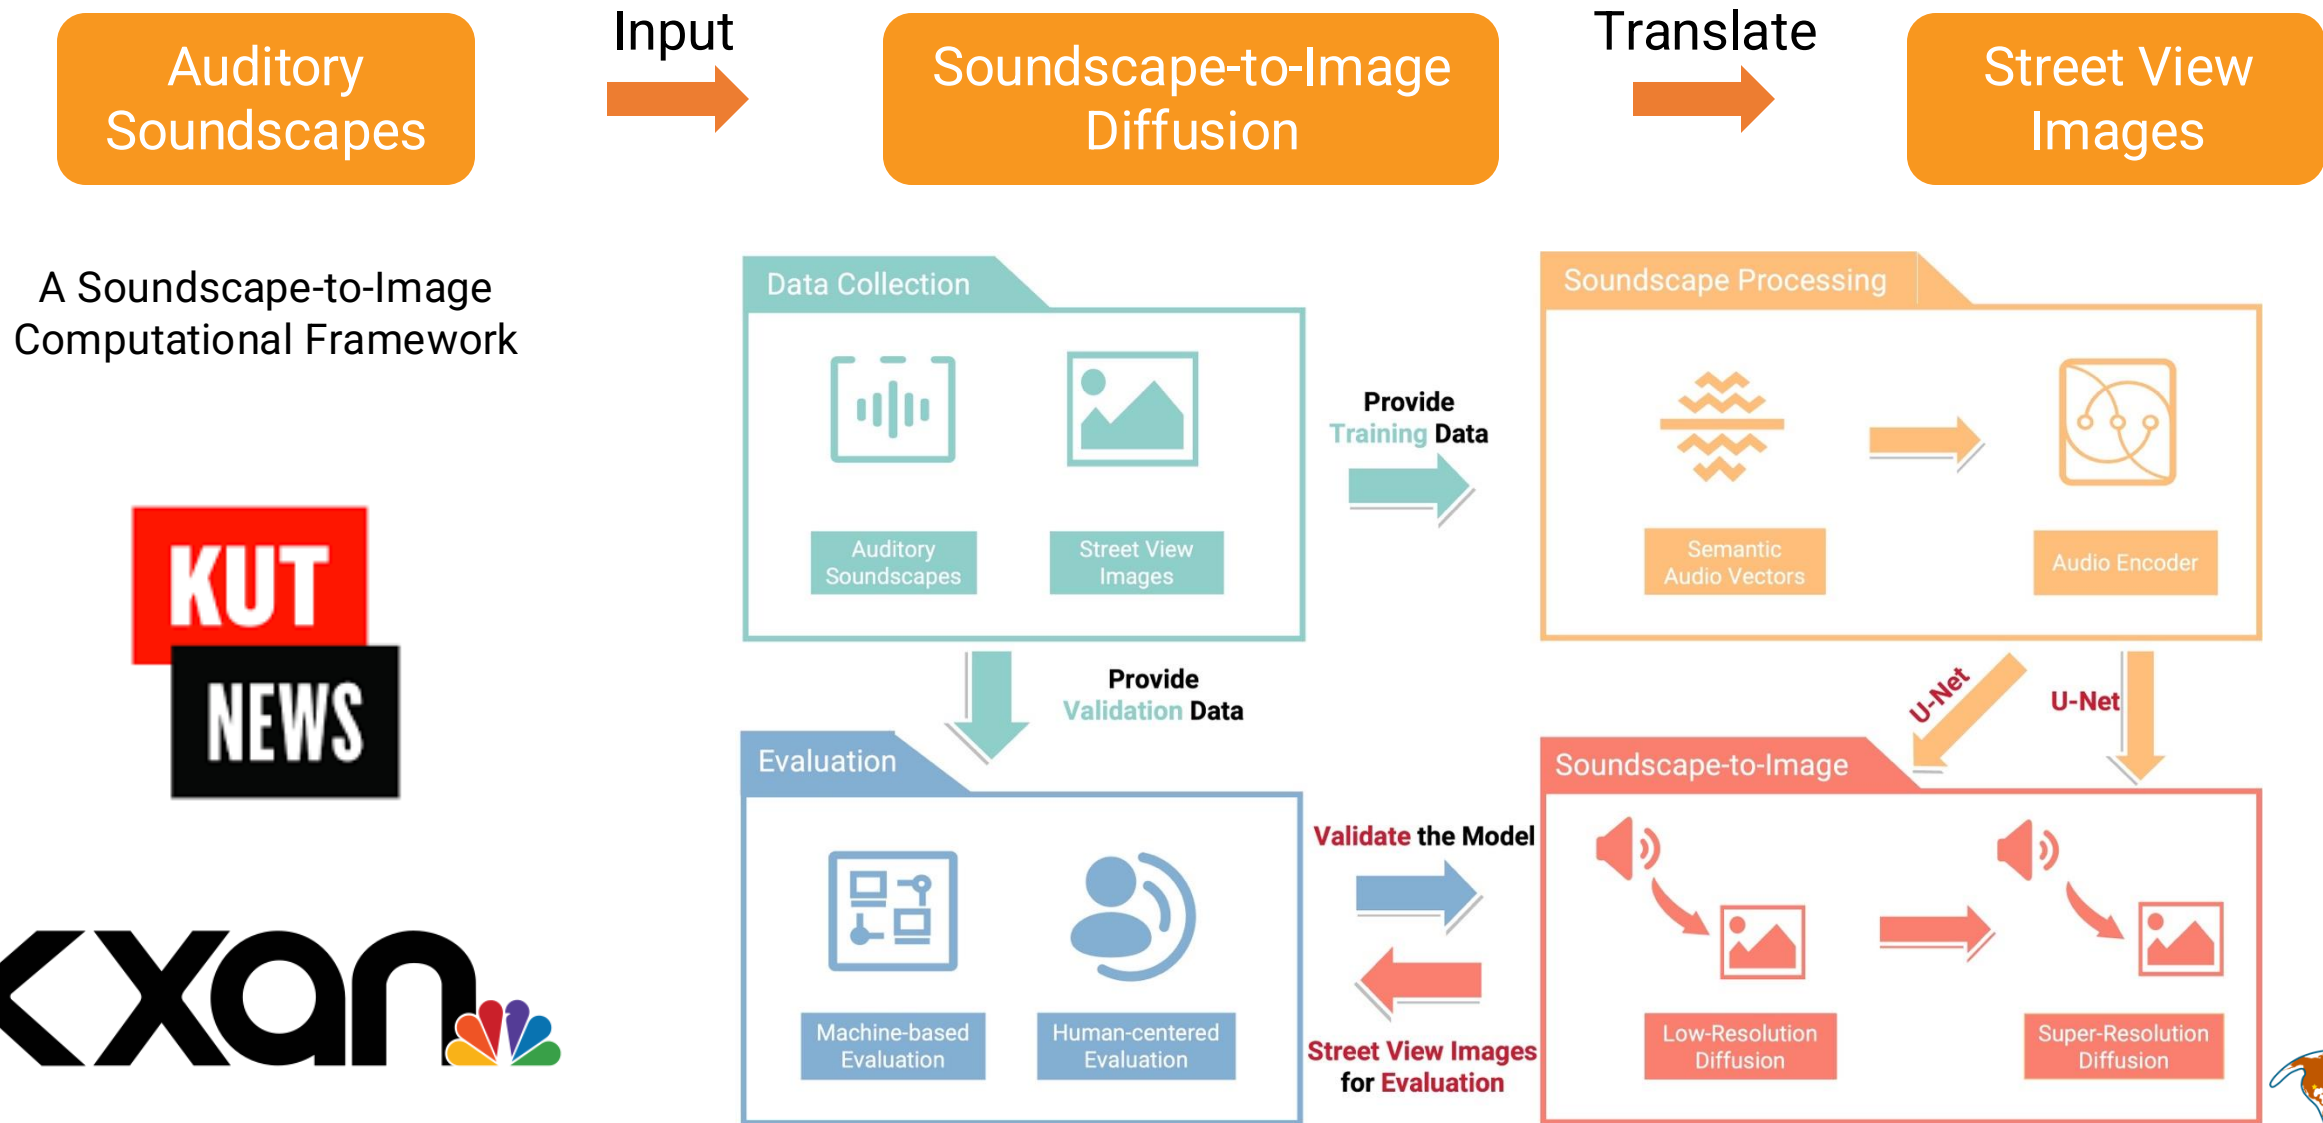

Image Analysis

Challenge

Most existing studies have focused on a **singular** dimension of the human sense of place while overlooking the complexity and depth of human-environment interactions, which are inherently shaped by **multi-sensory** experiences

A multi-sensory experience at Austin

Keywords

- “street walk”
- “city walk”
- “village walk”

Soundscape-to-Image Diffusion Model

- Extends Imagen, a text-to-image diffusion model released by Google Research
- Translate natural language text descriptions to photorealistic images using diffusion model

An example of the prompt "A brain riding a rocketship heading towards the moon."

Prior studies in image generation have faced challenges in evaluating the quality of generated samples, due to the significant differences between the generated and original images

We performed both **machine-based** and **human-centered** approaches to evaluate the image synthesis performance of our Soundscape-to-Image Diffusion model

1. Which one matches the audio the most?

▶ 0:00 / 0:10 ———— 🔊 ⋮

A

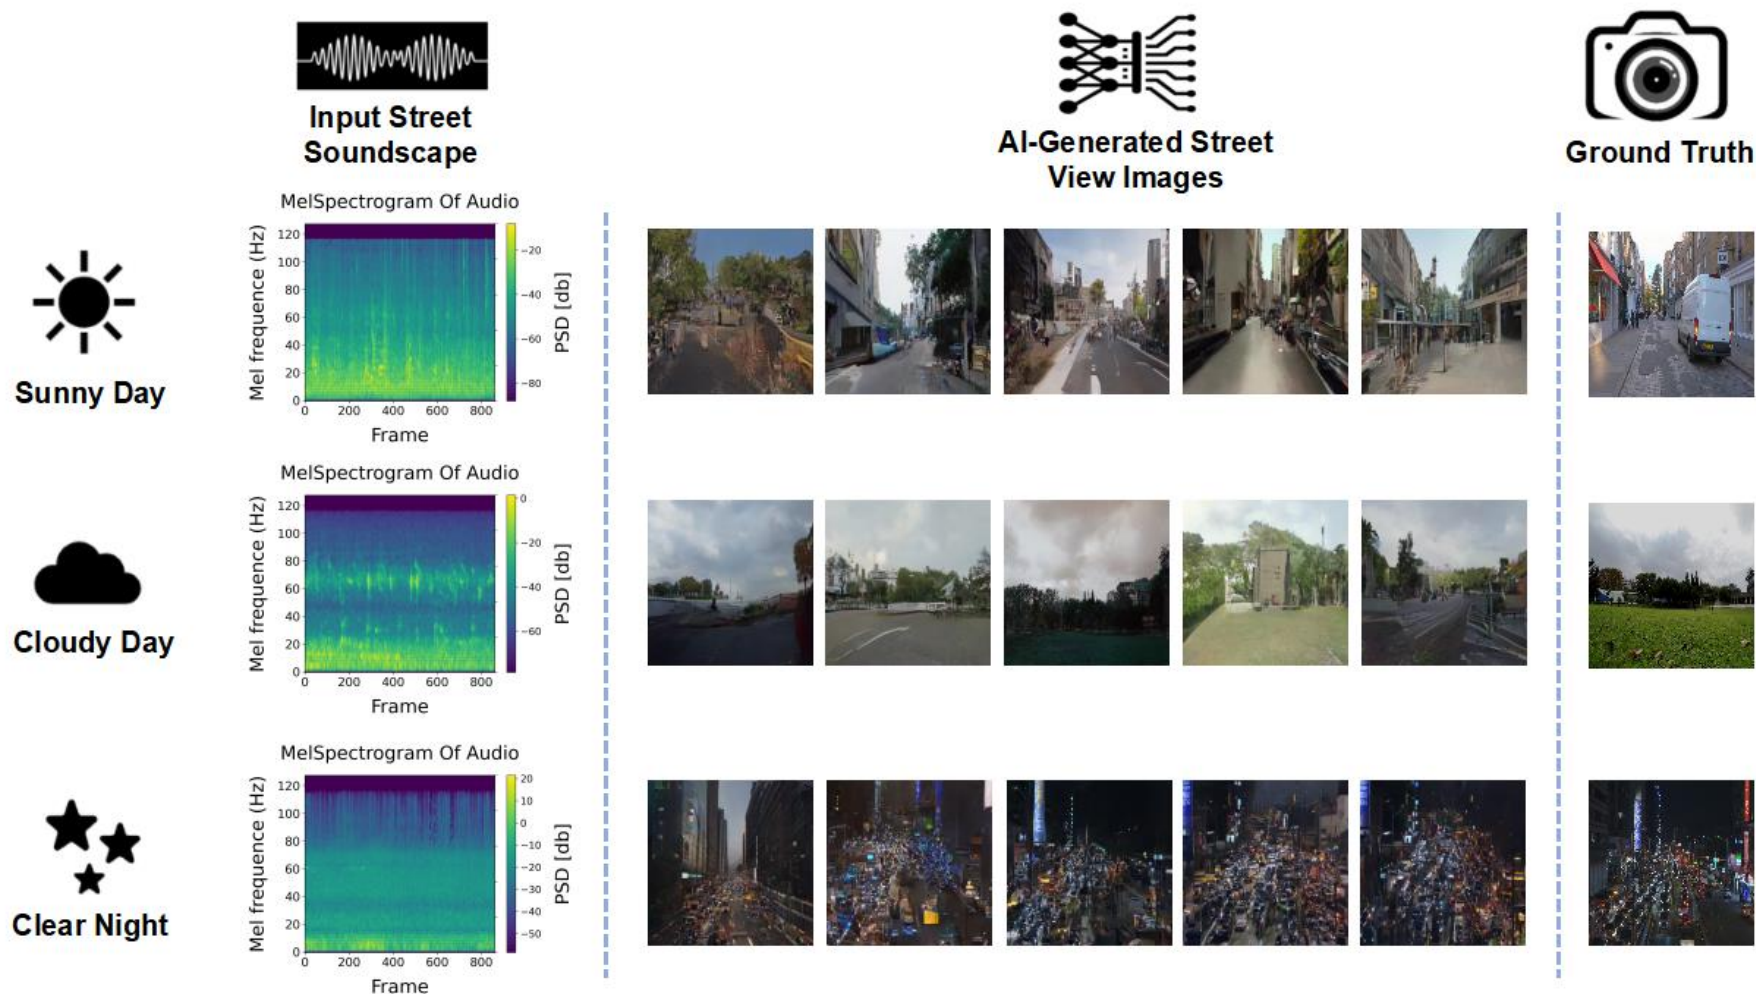

B

C

Participants achieve a matching rate of 80.455%

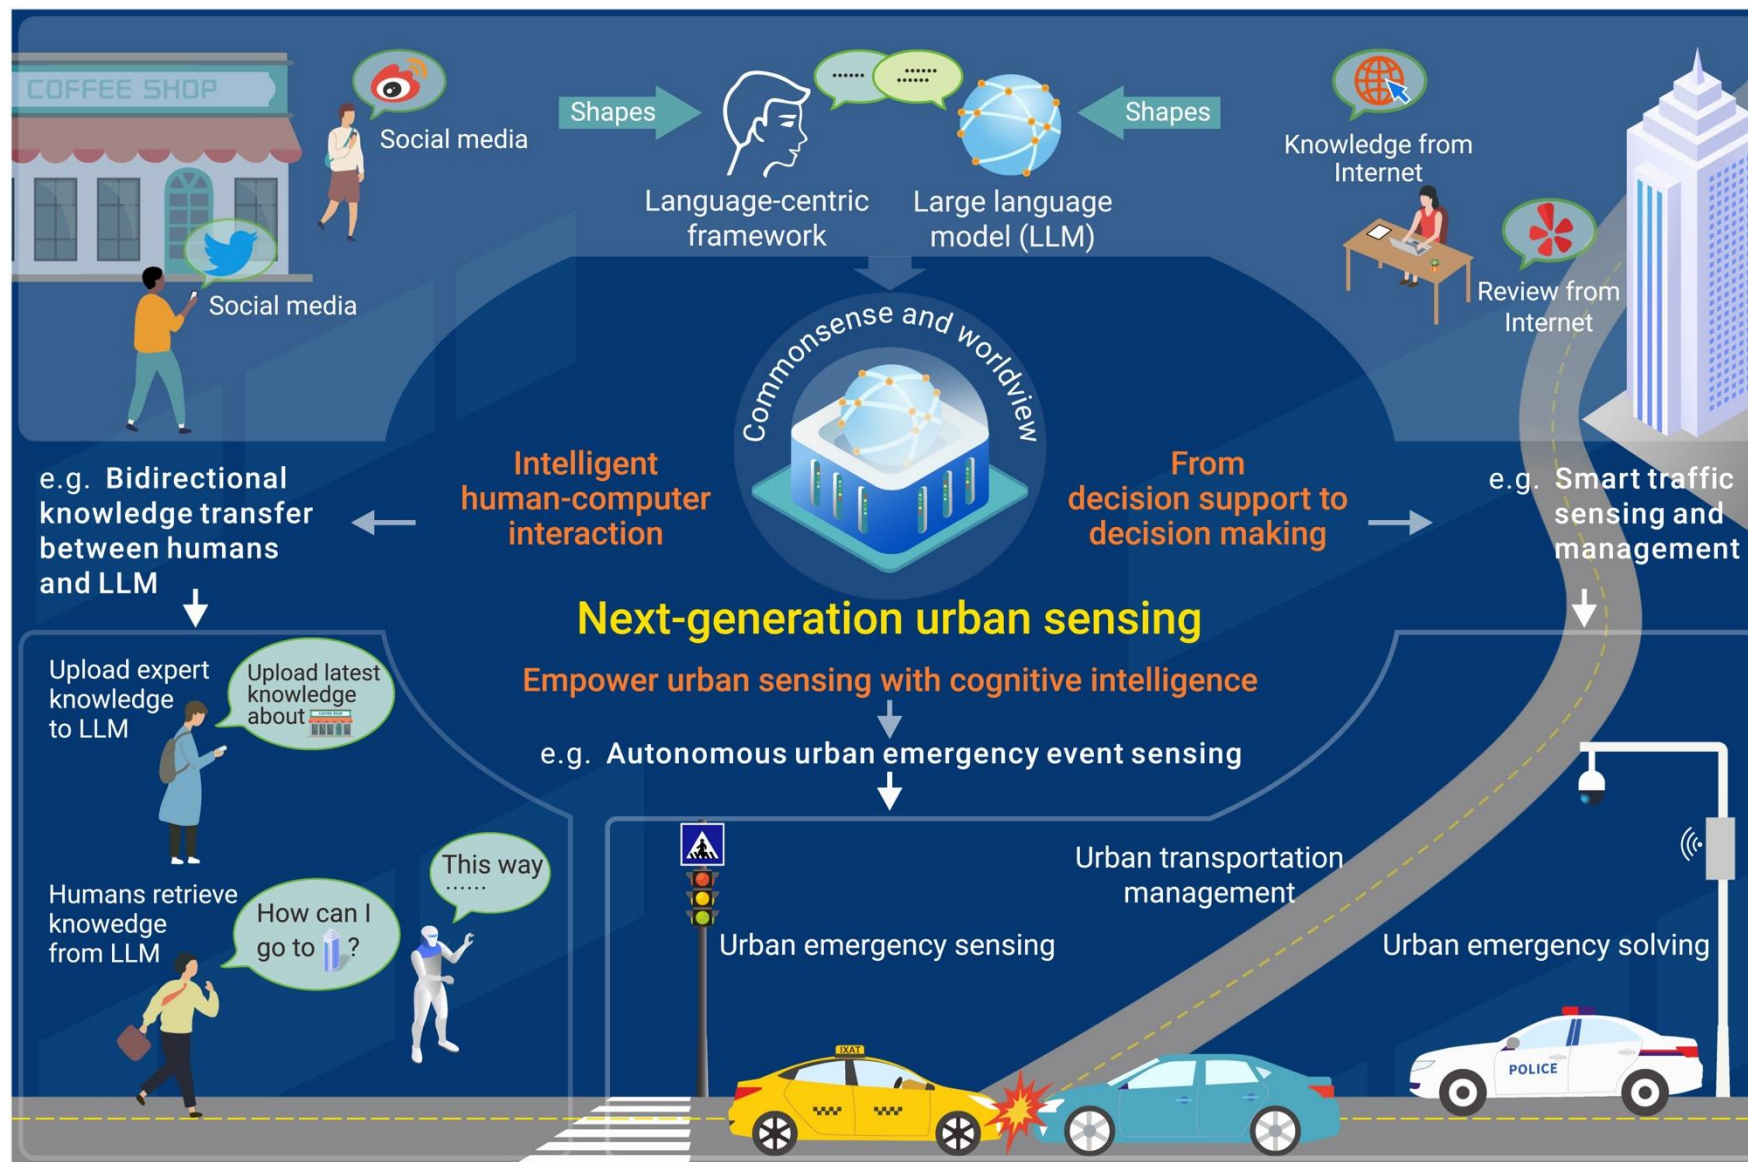

The Soundscapes-to-Images Diffusion Model generate images with different lighting conditions based on acoustic environment

Diffusion Models (DALLE) Perceive Beijing and London... 18

Beijing

London

- 1 ▶ Bias in training data and algorithms may lead to discrepancies between LLM and its idealized outcomes in human society
- 2 ▶ Lack of fine-grained spatiotemporal cognition
- 3 ▶ Challenges in capturing cultural and value diversity
